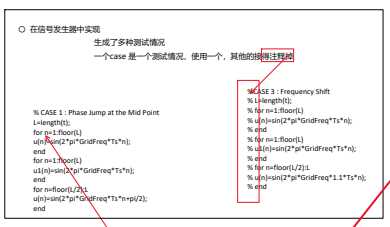
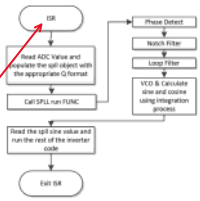
锁相环模拟测试

2020年4月17日 10:53

matlab代码解析

2020年4月17日 10:54





整个过程重复执行框图中的操作。在AD采集完成的中断服务程序中。 仿真只重复有限次数Tfinal/Ts，且（如果数据够多）n从几开始都没关系

% simulate the PLL process

for n=2:Tfinal/Ts % No of iteration of the PLL process in the simulation time

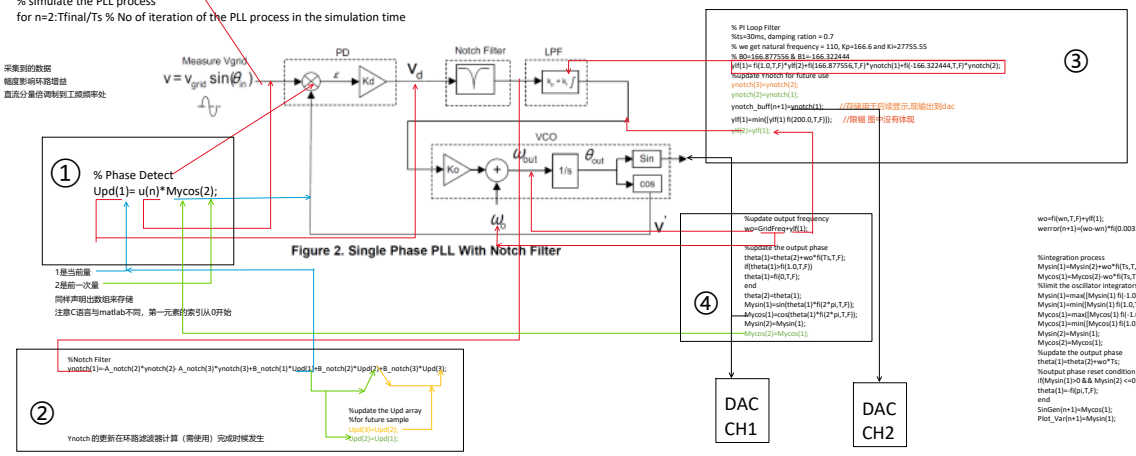


Figure 2. Single Phase PLL With Notch Filter

```
wo=fi(wn,T,F)+yff(1);
werror(n+1)=(wo-wn)*fi(0.00318309886,T,F);

%integration process
Mysin(1)=Mysin(2)+wo*fi(Ts,T,F)*(Mycos(2));
Mycos(1)=Mycos(2)-wo*fi(Ts,T,F)*(Mysin(2));
%limit the oscillator integrators
Mysin(1)=max([Mysin(1) fi(-1.0,T,F)]);
Mysin(1)=min([Mysin(1) fi(1.0,T,F)]);
Mycos(1)=max([Mycos(1) fi(-1.0,T,F)]);
Mycos(1)=min([Mycos(1) fi(1.0,T,F)]);
Mysin(2)=Mysin(1);
Mycos(2)=Mycos(1);
%update the output phase
theta(1)=theta(2)+wo*Ts;
%output phase reset condition
if(Mysin(1)>0 && Mysin(2) <=0)
theta(1)=-fi(pi,T,F);
end
SinGen(n+1)=Mycos(1);
Plot_Var(n+1)=Mysin(1);
```

Sine and Cosine Generation
The PLL uses sin and cos calculation, these calculations can consume large number of cycles in a typical microcontroller. To avoid this issue, the sine and cosine value is generated in this module by applying the principle of integration.

the coefficients for the notch filter can be adaptively changed as the grid frequency varies by calling a routine in the background that estimates the coefficients based on measure grid frequency.

```
%notch filter design
c1=0.1; c2=0.00001; X=2*c2*wn*2*Ts; Y=2*c1*wn*2*Ts; Z=wn*2*wn*2*Ts*Ts;
B_notch=[1 (X-2) (-X+Z+1)]; A_notch=[1 (Y-2) (-Y+Z+1)];
B_notch=fi(B_notch,T,F); A_notch=fi(A_notch,T,F);
```

Using Pre-Computation With the DF13 Controller

file:///E:/mcu/新建文件夹/C2000™%20Digital%20Controller%20Library%20users%20Guide.pdf

In control applications, the time between sampling the feedback and generating a corrective output is known as "sample-to-output delay". This delay imparts a phase lag into the loop that, in general, degrades performance. The computation time of the controller (and therefore the phase lag) can be reduced by precomputing those terms in the difference equation, which is already known when the new input sample arrives. The controller need then only compute one partial product, regardless of the order of the controller.

CMSIS-DSP library 浮点运算

2020年4月17日 17:17

http://www.keil.com/pack/doc/cmsis/DSP/html/group__sin.html#gae164899c4a3fc0e946dc5d55555fe541

arm_sin_cos_f32(float32_t theta, float32_t * pSinVal, float32_t * pCosVal);

Computes the trigonometric sine and cosine values using a combination of table lookup and linear interpolation.

float32_t arm_sin_f32 (float32_t x)

Parameters
[in] x input value in radians.

Returns
sin(x)

void arm_float_to_q15 (const float32_t *pSrc, q15_t *pDst, uint32_t blockSize)
Converts the elements of the floating-point vector to Q15 vector.

CMSIS DSP LIB ENABLE in STM32CUBEIDE

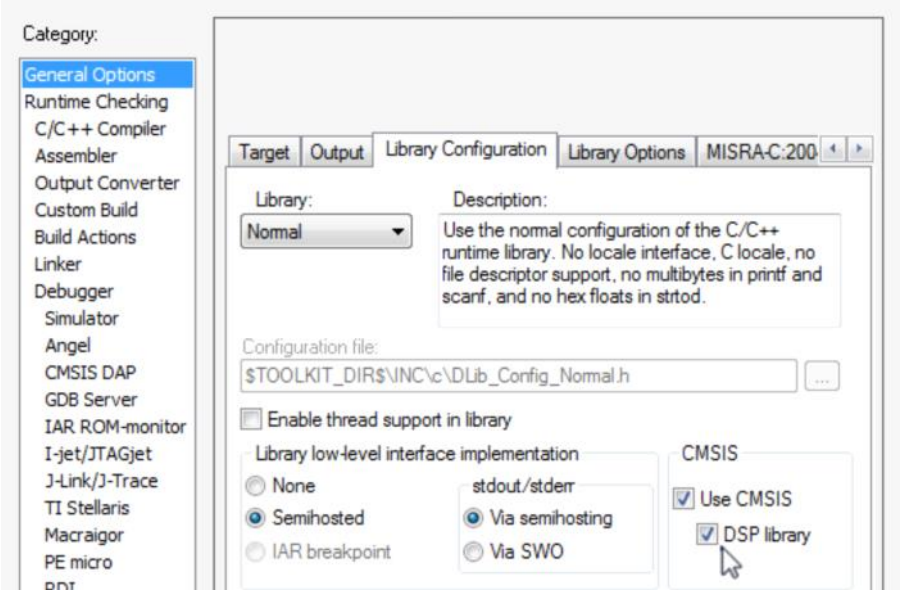
	 fsin = arm_sin_f32( fttheta	);
	 arm_mult_f32 (&fsin, &famp, &fsin, 1);
	 arm_float_to_q15 (&fsin, &mysin[i], 1);
	}
```

CMSIS-DSP library with IAR Embedded Workbench

2022年4月3日 6:04

you enable the use of the CMSIS-DSP library by first choosing a Cortex-M device,

Second, set the CMSIS-DSP library option in the General Options>Library Configuration page. This will set the PATH for C preprocessor and import the pre-build CMSIS library.



These settings are all you need to be able to use CMSIS-DSP from IAR Embedded Workbench for ARM.

信号源

2020年4月18日 15:51

dac原理

2020年4月10日 16:33

```
#define DAC_CR_EN1_Pos          (0U)
#define DAC_CR_EN1_Msk          (0x1UL << DAC_CR_EN1_Pos)          /*!< 0x00000001 */
#define DAC_CR_EN1              DAC_CR_EN1_Msk                     /*!<DAC channel1 enable */

#define DAC_CHANNEL_1                    0x00000000U
#define DAC_CHANNEL_2                    0x00000010U    // 十六进制的0x10 十进制为 16

#define __HAL_DAC_ENABLE(__HANDLE__, __DAC_Channel__)\
  (((__HANDLE__)->Instance->CR) |= (DAC_CR_EN1 << (((__DAC_Channel__) & 0x10UL))))
```

如果是通道1 DAC_CR_EN1 <<0 不进行左移操作

如果是通道2 DAC_CR_EN1 <<16 左移16位（bit）

```
 /* Enable the Peripheral */
  __HAL_DAC_ENABLE(hdac, Channel);
```

Note:

The ENx bit enables the analog DAC channelx only. The DAC channelx digital interface is enabled even if the ENx bit is reset.

在有些mcu中，要方位相应外设的寄存器（ digital interface） 要先使能其时钟。

SET_BIT(hdac->Instance->SWTRIGR, DAC_SWTRIGR_SWTRIG1);

通过Instance 的decalaration 找到

```
typedef struct __DAC_HandleTypeDef
#else
typedef struct
#endif
{
  DAC_TypeDef                 *Instance;    /*!< Register base address             */
```

通过 DAC_TypeDef 的decalaration 找到

```
typedef struct
{
  __IO uint32_t CR;      /*!< DAC control register,                    Address offset: 0x00 */
  __IO uint32_t SWTRIGR;  /*!< DAC software trigger register,           Address offset: 0x04 */
-- --

} DAC_TypeDef;
```

定位 到数据手册中的寄存器说明

21.7.1 DAC control register (DAC_CR)

Address offset: 0x00

Reset value: 0x0000 0000

21.7.2 DAC software trigger register (DAC_SWTRGR)

Address offset: 0x04

Reset value: 0x0000 0000

This bit is cleared by hardware (one dac_hclk clock cycle later) once the DAC_DHR1 register value has been loaded into the DAC_DOR1 register.

```
#define DAC_CR_TSEL1_Pos        (2U)
#define DAC_CR_TSEL1_Msk        (0xFUL << DAC_CR_TSEL1_Pos)        /*!< 0x0000003C */  四个bit 左移2位
#define DAC_CR_TSEL1            DAC_CR_TSEL1_Msk                   /*!<TSEL1[3:0] (DAC channel1 Trigger selection ) */
```

```
#define DAC_CR_TEN1_Pos         (1U)
#define DAC_CR_TEN1_Msk         (0x1UL << DAC_CR_TEN1_Pos)         /*!< 0x00000002 */
#define DAC_CR_TEN1             DAC_CR_TEN1_Msk                    /*!<DAC channel1 Trigger enable */
```

The DHRx register is then loaded into the DORx register either automatically, by software trigger or by an external event trigger.

？ 这三种情况分别是如何设置，又应用在什么场合 21.4.5 DAC conversion

The DAC_DORx cannot be written directly and any data transfer to the DAC channelx must be performed by loading the DAC_DHRx register

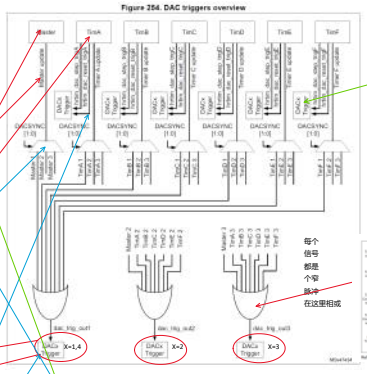
1、
if no hardware trigger is selected (TENx bit in DAC_CR register is reset).
DAC_DHRx register are automatically transferred to the DAC_DORx register after one dac_hclk clock cycle

2、
If the TENx control bit is set,
the conversion can then be triggered by an external event (timer counter, external interrupt line).
These events can be either the software trigger or hardware triggers， TSELx[3:0] control bits determine。
TSELx[3:0] bit cannot be changed when the ENx bit is set.

3、
If the software trigger is selected，（TSELx[3:0] = 0000: SWTRIG1）
the conversion starts（The DHRx register is then loaded into the DORx register） once the SWTRIG bit is set.

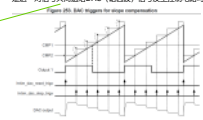
HRTIM 中 reset 与update 事件的区别与联系?

Figure 284. DAC triggers overview

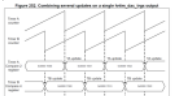


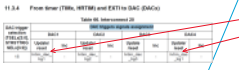
The update events from the master timer and the timer units can generate DAC update triggers on any of the 3 hrtim_dac_trgx outputs.

是这一对信号共同送给DAC（锯齿波）信号发生控制电路吗?



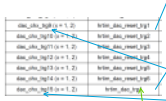
每个信号都是个窄脉冲在这里相或





An output pulse of 1 fHRTIM clock periods is generated on the hrtim_dac_trgx output.

为什么通常DAC都要精确（稳定）触发
对于快速变化的生成信号
触发不稳定，相当于在dac的输出中叠加了噪声



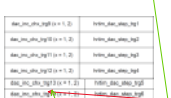


Figure 153. Dual-channel DAC block diagram

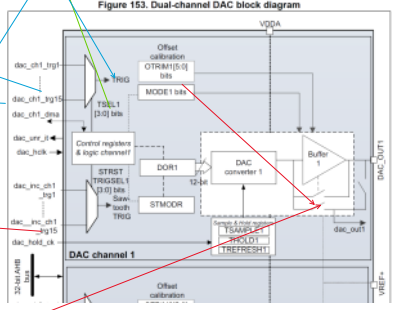
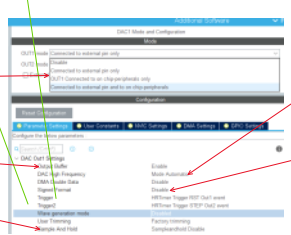


sConfig.DAC_HighFrequency = DAC_HIGH_FREQUENCY_INTERFACE_MODE_AUTOMATIC;

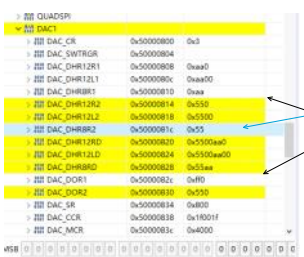
Table 177. HFSEL description

HFSEL[1:0]	AHB frequency	Function
00	≤ 80 MHz	DAC_DOR update rate up to 3 AHB clock cycles
01	>80 MHz[1]	DAC_DOR update rate up to 5 AHB clock cycles
10	>160 MHz	DAC_DOR update rate up to 7 AHB clock cycles
11	Reserved	-



Bits 17:16 MODE[2:0]: DAC channel2 mode
These bits can be written only when the DAC is disabled and not in the calibration mode (when bit EN2=0 and bit CEN2 =0 in the DAC_CR register). If EN2=1 or CEN2 =1 the write operation is ignored.
They can be set and cleared by software to select the DAC channel2 mode:
- DAC channel2 in Normal mode
000: DAC channel2 is connected to external pin with Buffer enabled
001: DAC channel2 is connected to external pin and to on chip peripherals with buffer enabled
010: DAC channel2 is connected to external pin with buffer disabled
011: DAC channel2 is connected to on chip peripherals with Buffer disabled
- DAC channel2 in Sample and hold mode:
100: DAC channel2 is connected to external pin with Buffer enabled
101: DAC channel2 is connected to external pin and to on chip peripherals with Buffer enabled
110: DAC channel2 is connected to external pin and to on chip peripherals with Buffer disabled
111: DAC channel2 is connected to on chip peripherals with Buffer disabled
Note: This register can be modified only when EN2=0

DAC mode control register (DAC_MCR)
Address offset: 0x3C
Bit 25 SINFORMAT2: Enable signed format for DAC channel2
This bit is set and cleared by software.
0: Input data is in unsigned format
1: Input data is in signed format (2's complement). The MSB bit represents the sign.



DAC内部DHR寄存器只有一个
为了方便编程，不同位数，对齐方式的多个可访问地址；
任意更新其中一个
相关联的寄存器
的值都发生了改变（debuger黄色提示）

DOR2最之改变，是因为TEN位没有置位

Dac1 TEN 置位了，所以DOR1没变（没有触发信号到来）

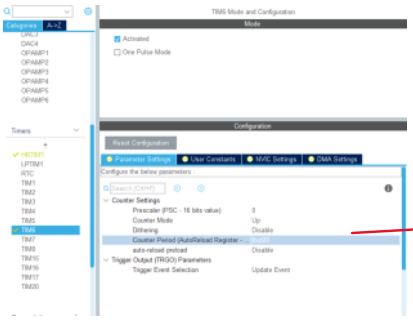
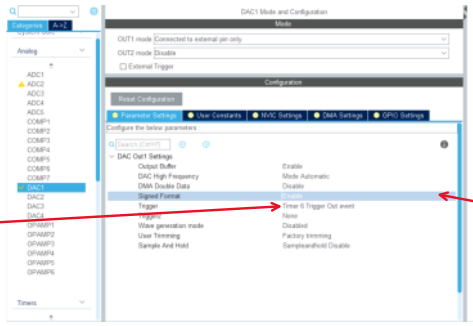
DAC具体配置

2020年4月18日 16:03



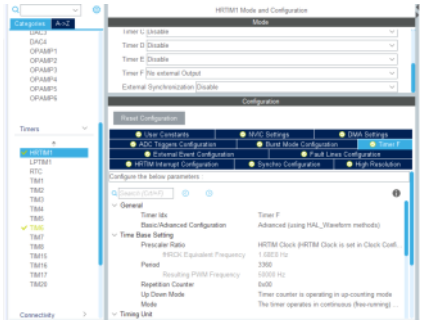


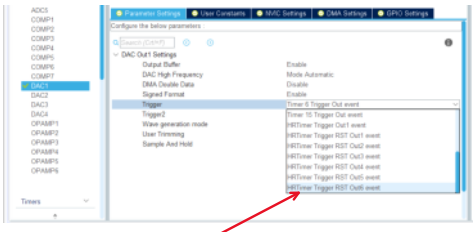
When SINFORMATx bit is set, the MSB bit of the data written to DHRx registers is inverted when it is copied to the DAC_DORx register, and the DAC interface can accept signed data (Q1.15, Q1.11 or Q1.7 format). DAC_DHR12Lx register can be used to store 16-bit signed data in the data holding registers. The 12 MSBs of 16-bit data are used for the DAC output data and the MSB bit is inverted. The four LSBs are simply ignored.

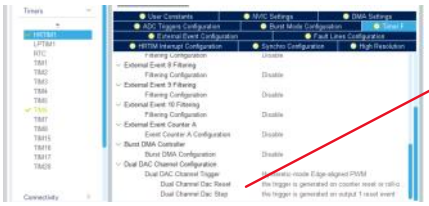
选定有符号位的数据格式

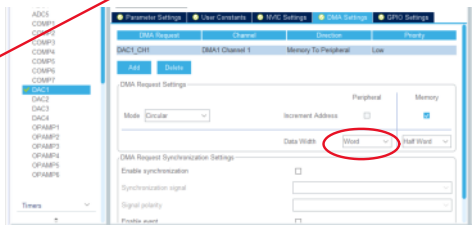
方便使用： arm_float_to_q15 &fsin, &mysin[i], 1);

转换浮点数到整型







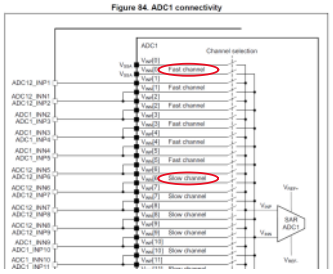


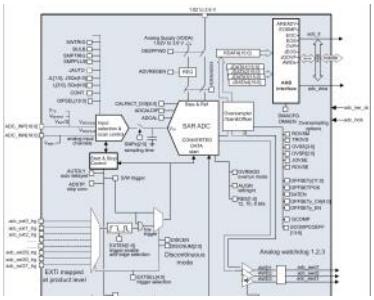
pll

2020年4月19日 7:17

ADC

2020年4月10日 7:17





Regular conversion can then start either by setting ADSTART=1 (refer to Section 21.4.18: Conversion on external trigger and trigger polarity (EXTSEL, EXTEN,JEXTSEL, JEXTEN)) or when an external trigger event occurs, if triggers are enabled.

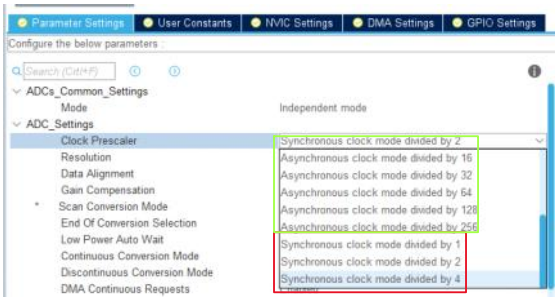


Figure 83. ADC clock scheme

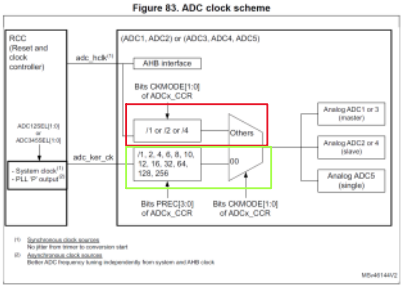
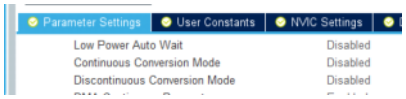




Single conversion mode (CONT=0)

Continuous conversion mode (CONT=1)

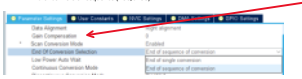
the ADC performs once all the regular conversions of the channels and then automatically restarts and continuously converts each conversions of the sequence.

It is not possible to have both discontinuous mode and continuous mode enabled: it is forbidden to set both DISCEN=1 and CONT=1.

21.4.20 Discontinuous mode

21.4.23 End of conversion, end of sampling phase (EOC, JEOC, EOSMP)

21.4.24 End of conversion sequence (EOS, JEOS)



Gain compensation

When GCOMP bit is set in ADC_CFGR2 register, the gain compensation is activated on all the converted data. After each conversion, data is calculated with the following formula.

DATA = DATA(adc result) × (GCOMPCOEFF) / 4096

As GCOMPCOEFF can be programmed from 0 to 16383, the actual gain compensation factor can range from 0 to 3.999756.

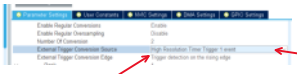


Table 161. Configuring the trigger polarity for regular external triggers

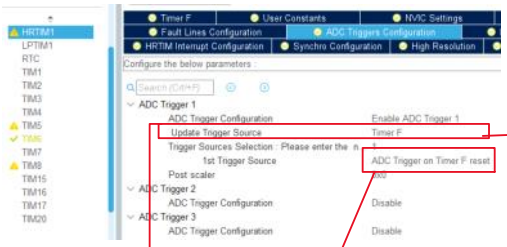
EXTEN[1:0]	Source
00	Hardware Trigger detection disabled, software trigger detection enabled
01	Hardware Trigger with detection on the rising edge
10	Hardware Trigger with detection on the falling edge
11	Hardware Trigger with detection on both the rising and falling edges

Table 163. ADC1/2 - External triggers for regular channels

Name	Source	Type	EXTSEL[4:0]
adc_ext_trg21	hrtim_adc_trg1	Internal signal from on-chip timers	10101



HRTIM_ADC1R to HRTIM_ADC4R and HRTIM_ADCER registers are preloaded and can be updated synchronously with the timer they are related to.
When the preload is disabled (PREEN bit reset) in the source timer, the HRTIM_ADCxR registers are not preloaded either: a write access results in an immediate update of the trigger source.

低通滤波，获取直流偏置，可以在更新输出后运算

Discrete Transfer Function

Bilinear Transformation with Prewarping
Sample Frequency = 50.00 KHz

$$\frac{6.279e\text{-}04*Z + 6.279e\text{-}04}{Z - .9987}$$

1st Order Low Pass Butterworth
Pass Band Frequency = 10.00 Hz

Mon Apr 20 12:00 2020

$$H(z) = \frac{C(k)}{R(k)} = \frac{6.28e\text{-}4(1+z^{-1})}{1-0.9987z^{-1}}$$

$$C(k) = 6.28e^{-4}(1+z^{-1})R(k) - \frac{(-0.9987)C(k-1)}{4}$$

误差累积，不会收敛 C(k)发散吗
